2.Project: Registering and examining the Congenital Heart Diseases Children in Kurdistan Region

The epidemiological studies are recording large number of the children with congenital heart diseases in Iraq and Kurdistan Region. The non-availability of the necessary interventional methods urged Heevie to develop a strict program for providing the required assistance to those patients. This was done in cooperation with SIA Italian NGO and in coordination with the different Italian hospitals and specialized centers. Through this program, Heevie took the initiative to build up and establishing a data base for the patients Congenital Heart Diseases in KRI and Iraq. Through this project, Heevie Organization is doing a regular documentation for all the possible cases of congenital heart diseases to make their information ready and available if any treatment or intervention modality required.

This is one of the first and most active Heevie programs and is having a great impact on the outcomes of these diseases and the life style of the patients. In addition to treating the patients, the program involved training of the doctors (mainly pediatricians) on the diagnostic procedures like the Echocardiography examination, for the patients with congenital heart diseases in Italy, in addition to providing Echocardiography machines for the main hospitals and centers in Duhok, Erbil and Sulaymaniyah. During 2020, Heevie has so far added **(291)** new cases of children with congenital heart diseases to its existing data base.

Project: Registering and examining the Congenital Heart Diseases Children,2019
